

Prompt A continuous gently translating short-arc walk along a conifer creek-side clearing in natural early-autumn daylight. First establish the gabled timber ranger cabin with a stone chimney, the short parallel-log creek crossing front-left and covered stacked-log rack on the right. Turn smoothly toward the populated work canopy, low workshop and separate annex until the original cabin completely leaves the view. Continue translating, then look back from a new position at the same cabin, log crossing and wood rack. Preserve their structure, identity, materials and world-space adjacency, including the creek bank and boulder. The short bridge stays made of round logs, not a different plank or stone bridge. No cuts or abrupt swings.
